

Ailez Aktilek, AI Engineer | AI Research

📍 Kazakhstan, Астана ✉ aktyailez@gmail.com 📞 +7 747 625 3153

SUMMARY

AI Engineer / Research Engineer focused on LLM-based products, multi-agent systems, RAG, MCP integrations, and model training. Hands-on experience spans fine-tuning, reinforcement learning, custom training objectives, evaluation pipelines, memory architectures, and prompt/config optimization. Developed a proprietary model-training method under NDA. Contributed to 7 AI projects and 12 demos across applied research, AI platforms, agent workflows, and business forecasting.

SKILLS

AI / LLM: cloud and local LLMs, OpenAI GPT, Anthropic Claude / Claude Code, open-source LLMs, prompt engineering, tool calling, Model Context Protocol (MCP), MCP integrations, multi-agent systems, memory architectures, evaluation, model selection, prompt/config optimization

RAG / Search: Retrieval-Augmented Generation, multi-level RAG, semantic search, embeddings, vector databases, knowledge-base design, document understanding

ML / Research: model training, reinforcement learning (RL), LLM fine-tuning, LoRA/QLoRA, custom training objectives, training-method development, PyTorch, scikit-learn, CatBoost, Gradient Boosting, ElasticNet, feature engineering, experiment design, research paper reproduction

Engineering: Python, FastAPI, Docker, SQL, REST APIs, Git, data pipelines, API integrations

EXPERIENCE

AI Engineer / Research Engineer

Jan 2025 - Present

Infiano AI - AI product and research company

- Contributed to 7 AI projects and 12 demos for business automation by designing LLM-based agent workflows, retrieval flows, memory components, moderation logic, and model-configuration strategies.
- Reduced LLM usage cost from several percent to up to 5-10x in selected workflows by combining model selection, prompt/context optimization, caching-aware design, RAG-based context reduction, and research-driven cost strategies.
- Designed production-oriented multi-agent workflows with up to ~30 agents by defining tool schemas, memory/RAG/moderation/evaluator flows, config patching, async triggers, user profiles, and long-term memory components.
- Built evaluation and auto-tuning capabilities used in product workflows by creating 10+ evaluator tools and 6+ custom evaluators from scratch, enabling prompts, configs, and model outputs to be compared automatically instead of relying only on manual review.
- Researched and applied model-training and adaptation methods, including reinforcement learning, LoRA/QLoRA, low-resource fine-tuning, custom training objectives, semantic similarity objectives, and attention/coverage losses.
- Developed a proprietary model-training method as part of confidential AI research; technical details and results are covered by NDA.

ALCOMARKET KZ - retail company

- Built ML workflows for 4 retail analytics use cases: pricing, demand elasticity, Run Rate forecasting, and Out-of-Stock loss estimation.
- Supported pricing and inventory decisions by preparing sales, pricing, stock, and product datasets, engineering features, evaluating models, and translating outputs into business-readable insights.
- Analyzed sales trends, price sensitivity, and stock-gap losses to help business teams identify pricing and inventory optimization opportunities.
